REFLECTION:

What worked well is that the AI was able to quickly generate what I wanted by just typing the prompt. It was able to generate a one page website with organized sections and a clear layout. It was also easy to improve the design step-by-step using prompts, and the navigation and structure became more polished after refinement.

What needed fixing was some spacing, text alignment, and visual balance needed adjustment after the initial output. A few sections also needed clearer wording and better styling to make the website more visually appealing and easier to read.

What I learned about prompting is that I realized I had the freedom to do such things, to explore, to make something unique, and to explore digital functions. I also learned that clear and specific prompts produce better results. Improving the website step-by-step through multiple prompts helps refine both design and functionality. I also learned that iterative prompting is important for building a more professional and complete output.
